HUMAN FORM
RECOGNITION CAMERAS

The Technology:

Human form recognition cameras are unique in their ability to distinguish between a person and another obstruction, by using only Artificial Intelligence - no tags, sensors or radar. This provides visual and audible warnings to the operator, informing them of red zone incursions or if a collision with a pedestrian is imminent.

The Features:

HFR Cameras provides onboard storage of red zone incursions and 10 second video capture, providing transparency with access to real time alert data with time, date and location stamps of any incursions. GPS, live vehicle tracking and camera streaming allows for fleet management, and the system allows for statistical data analysis.

The Benefits:

The cameras only alert the operator when they detect the human form. There are no alerts for unnecessary distractions, reducing driver distractions. All pedestrians are protected.
